|                                                                                                                                                                                                                                                                                                                |                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <div>Step to do</div> <div><b>Step 1: Open Your Browser</b><br/>Go to<br/><a href="https://bulanbintanghq.com">https://bulanbintanghq.com</a><br/><br/>Take a screenshot of the homepage (this is your "Target" proof)</div>                                                                                   | <div>Output/Result</div> <div></div> |
| <div><b>Step 2: Find the IP Address (DNS Lookup)</b><br/>On Windows:<br/><br/>Press Windows Key + R, type cmd, press Enter<br/><br/>Type: nslookup<br/>bulanbintanghq.com<br/><br/>Press Enter</div>                                                                                                           | <div></div>                        |
| <div><b>Step 3: Find Who Owns the Domain (WHOIS Lookup)</b><br/>Easy method (no terminal needed):<br/><br/>Go to<br/><a href="https://whois.domaintools.com">https://whois.domaintools.com</a><br/><br/>Type: bulanbintanghq.com<br/><br/>Click "Search"<br/><br/>and the output will be like that -&gt;</div> | <div></div>                       |

**Step 4: Find What Technology the Website Uses**

Wappalyzer (Recommended - Free Browser Extension):

Open Chrome or Firefox browser

Go to Chrome Web Store or Firefox Add-ons

Search for "Wappalyzer"

Click "Add to Chrome" / "Add to Firefox"

Once installed, go to <https://bulanbintanghq.com>

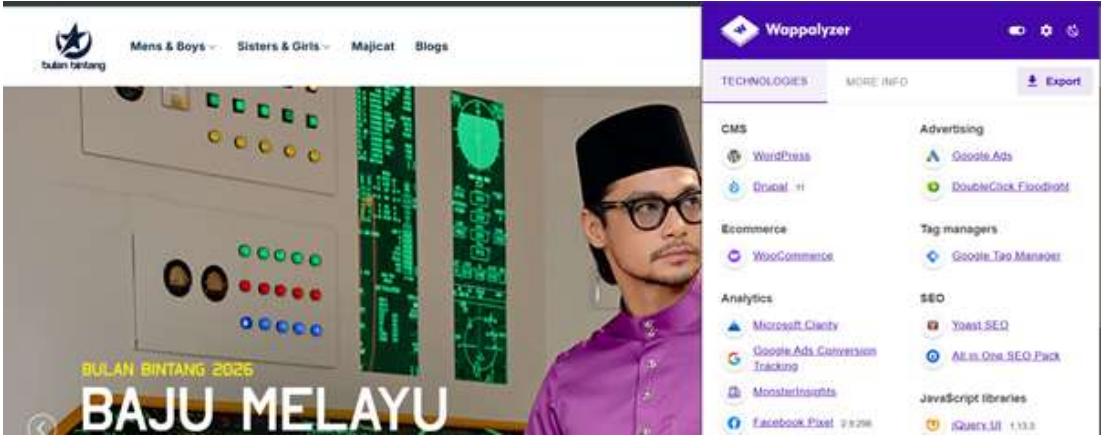

Click the Wappalyzer icon (looks like a blue hexagon) in your browser toolbar

**Step 5: Find Extra Information on the Website Itself**

Go to <https://bulanbintanghq.com/my-account/>

You'll see a Login / Register form

This is a security finding (attackers can target this)

| Step                 | Tool                             | Finding                                                                                                             | Interpretation                                                                                                                                                                        | Mitigation                                                                                                                               |
|----------------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Pick Target       | Manual                           | bulanbintanghq.com – Malaysian clothing brand selling Baju Melayu & Baju Kurung                                     | An attractive target for hackers is an e-commerce website that handles user logins and payments.                                                                                      | N/A (this is the chosen target)                                                                                                          |
| 2. WHOIS/DNS         | nslookup + whois.domaintools.com | IP: 172.67.68.161<br>Registrar: GoDaddy.com, LLC<br>Name Servers: GREG.NS.CLOUDFLARE.COM                            | The website is hosted on a server in the United States (probably shared hosting). Shared hosting implies that other websites on the same server could be vulnerable if one is hacked. | To conceal your true IP address, use a dedicated server or cloud WAF (Cloudflare).                                                       |
| 3.WhatWeb/Wappalyzer | Wappalyzer Extension             | CMS: WordPress<br>E-commerce: WooCommerce<br>Web Server: nginx/Apache<br>Tracking: Google Analytics, Facebook Pixel | The most compromised CMS combination is WordPress + WooCommerce. There may be known vulnerabilities in older plugins or themes.                                                       | Maintain automatic updates for WordPress core, themes, and plugins. Install the Wordfence security plugin. When logging in, use CAPTCHA. |
